

Assalamu alikum everyone.

First of all I would like to thank ma'am for giving me the opportunity to speak here today. Imagine you have an emergency situation and you go to the hospital. Two doctors come to see you. The first one is a human, with years of experience. The second one is AI, a very smart computer program. Now, imagine research shows that the AI is better, it finds diseases earlier and suggests more accurate solutions than human doctors.

My question to you is: If AI is performing better than human doctors, should it be allowed to make our medical decisions?

I believe that yes, it should. But not alone. The future of medicine isn't about humans or machines. It's about humans and machines working together for better treatment.

Let's talk about three reasons why humans and doctors should work together.

Reason 1: Superhuman Accuracy

First, AI has what we can call superhuman accuracy.

Think about looking for a needle in a haystack. A human will look carefully, but it will take a very long time and they might get tired. An AI can look at that same haystack and see not just the needle, but its exact type, size, and even tiny scratches on it.

In medicine, this is a huge deal. For example, in looking at X-rays or scans for cancer, the best AI systems can now spot tiny tumors that are literally invisible to the human eye. They don't get tired after looking at 100 or 1000 scans. They don't have a bad day. A study from 2023 showed that an AI could detect breast cancer more accurately than a single radiologist.

Reason 2: The Power of Data

My second point is about data. An AI can read more medical information than any human ever could.

A human doctor might read thousands of medical journals in their lifetime. But an AI can read millions of journals, every known medical case study, and a patient's entire medical history all in seconds.

Let me give you an example. A patient might have a very rare disease. A human doctor may have only read about it in a textbook years ago. But an AI can instantly compare

that patient's symptoms to every single recorded case of that rare disease from around the world. It can then suggest the treatments that worked best for people of the same age, gender, and genetic background.

It's like having the world's best assistant by your doctor's side, 24 hours a day.

Now, I know some of you might be thinking. "Can we trust a machine?" "What about the human touch?" These are very important questions.

Let's be clear: I am not suggesting that we replace doctors with AI. We can not replace the human touch. Because

Who will hold your hand when you get bad news?

Who will understand your fear and explain things with emotion? A doctor.

AI cannot do these things. And it shouldn't because AI does not have any emotion or feelings.

Reason 3: Making Healthcare Fair for Everyone

Finally, this partnership can make healthcare more fair and available to everyone.

Today, the best doctors are only available in big cities. What about the people who live in small towns or poor countries? They might not have access to a top cancer specialist. But an AI can be anywhere. We can put this as a doctor's assistant in a small clinic anywhere in the world. It can help a local doctor and make sure high-quality diagnosis that someone in a world-class city hospital would get.

This isn't science fiction. It's already happening in some places, helping to close the gap between the rich and the poor in healthcare.

AI is not a threat to doctors. This isn't about replacing doctors. It's about giving them a super-powerful tool. It's like using a calculator for math. You still need to know the problem, but the calculator ensures the answer is correct.

So, when we ask, "Should AI be allowed to make medical decisions?" The answer is yes not as our only doctor, but as our doctor's greatest partner.

Thank you.
